Flat-Pack Bit Guide: The Right HOTO Bit for Every Job

The HOTO kit carries 25 S2 steel bits. This guide maps the ones flat-pack furniture and household jobs actually use, so you stop chewing up screw heads with the wrong bit.

Job	Bit	Torque tip
IKEA and flat-pack furniture	Pozidriv PZ2 (and PZ1 for small fittings)	Use the mid torque setting. Pozidriv is the correct fit for IKEA screws - a Phillips bit cams out and strips them.
Door hinges, handles, latches	PH2 (use the long 50mm PH2 for recessed screws)	Start screws by hand for two turns so they bite straight.
PC builds and case work	PH1 / PH2	Lowest torque setting. Snug is enough - motherboard screws strip fast.
Light fittings and switch plates	SL4 / SL6 flathead	Power OFF at the breaker first. Lowest torque, finish by hand.
Bikes, toys, appliances (hex bolts)	H3 / H4 / H5 hex	Mid setting. If the driver stalls, switch to manual mode instead of forcing it.
Star-head screws (furniture, electronics)	T15 / T20 / T25 Torx	Match the size exactly - one size small rounds the star points.

The screw-holding trick

The 24 short bits are not magnetic - only the long PH2 is. For ceiling or overhead screws, start the screw by hand, or rest it on the long PH2. The magnetic chuck holds the bit, not the screw.
